## Skier triggered avalanche on Mt. Blackmore

Mt Blackmore Northern Gallatin 3/6/2019 Code SS-ASu-R2-D1.5-I Aspect NE Latitude 45.44550 Longitude -111.00400 Notes

## From an email:

"I'd like to report an avalanche incident that occurred today, 3/6, around 2 PM on the NE face of Mt. Blackmore in the Hyalite Canyon area. On the approach, I dug a pit at 9400' and found a very stable and deep snowpack, with a somewhat definite <a href="weak layer">weak layer</a> in between high and medium density snow about 8" deep. The layer did not <a href="slide">slide</a> or propagate in an extended column pit test, so my partner and I decided do ski the direct line from the summit. I skied first, making a <a href="ski cut">ski cut</a> just below the ridge line that did not result in any sloughing. I skied the line without mishap. My partner followed, traversing onto a shallow, steep pocket, releasing the avalanche. It propagated down and out in both directions, resulting in a v-shaped crown about 100' across and 8-12" deep. The <a href="slide">slide</a> ran from around 9800' to 9400'. My partner was not caught and was able to traverse out and ski down safely."

Number of slides 1 Number caught 0 Number buried 0

Avalanche Type Soft slab avalanche

Trigger Skier

Trigger Modifier

u-An unintentional release

R size

2

D size

1.5

**Bed Surface** 

I - Interface between new and old snow

Problem Type

Persistent Weak Layer

Slab Thickness

10.0 inches

Vertical Fall 400ft Slab Width 100.00ft Images Skier triggered on M
