

Blowing snow and developing wind slabs at B Bowl

Date

Wed, 11/06/2024 - 08:35

Activity

Skiing

Toured up to the top of PK this morning to check out the fresh snow and see if we could eek out some early season turns. Cold temps to start the day with some light to moderate wind out of the NW and evidence that the wind was certainly blowing snow around during the storm over the past 24 hours or so. Did not see any significantly developed slabs in a multitude of hand pits at mid elevations, but noticed a relatively consistent 2-4 inch denser layer (from the wind) on top of the softer snow below.

Region

Bridger Range

Location (from list)

Bridger Bowl
